

Species and Subspecies of San Diego County Birds

This list includes all birds occurring in San Diego County naturally plus well-established nonnative species. Birds covered in the *San Diego County Bird Atlas* under Exotic and Hypothetical Species, such as the Black-throated Magpie Jay (*Calocitta colliei*), are excluded. The total is 498 species, plus 89 additional subspecies, for a total of 587 taxa of birds known from San Diego County. At the level of species the classification and nomenclature are those of the American Ornithologists' Union checklist committee (<http://www.aou.org/checklist/index.php3>). At the level of subspecies the classification reflects my current understanding, based on the principle that a subspecies constitutes a subset of a species with a breeding range and physical features (color, pattern, size, proportions) different from those of other subsets of the species. Subspecies enclosed in brackets are inferred, not based on identification of specimens or characteristics discernable in the field. English names of subspecies are not standardized and drawn from various sources.

Breeding status: B, breeding confirmed; B†, breeding confirmed only before 1997 (sporadically breeding or extirpated species); P, breeding probable or possible; I, introduced (not native).

Regulatory status (as of January 2008): E, endangered; T, threatened; SC, species of special concern; 1, first priority; 2, second priority; 3, third priority; US, U. S. Fish and Wildlife Service; CA, California Department of Fish and Game. Some species are designated as of special concern only in limited roles; in those cases, if the species does not occur in that role in San Diego County, the status is not entered in this table. For example, the American White Pelican is considered a species of special concern in the role of breeding, but the American White Pelican is not known ever to have bred in San Diego County, even though it occurs regularly as a nonbreeding visitor, so there is no entry for regulatory status for it.

Documentation: SDNHM, specimen persevered in San Diego Natural History Museum. If a specimen has been preserved only in another museum, that museum is cited. CSULB, California State University, Long Beach; DEL, Delaware Museum of Natural History, Greenville; FMNH, Field Museum of Natural History, Chicago; LACM, Natural History Museum of Los Angeles County, Los Angeles; MVZ, Museum of Vertebrate Zoology, University of California, Los Angeles; SBCM, San Bernardino County Museum, Redlands; UCLA, University of California, Los Angeles; UMMZ, University of Michigan Museum of Zoology, Ann Arbor; USNM, National Museum of Natural History, Smithsonian Institution, Washington, D. C.; WFVZ, Western Foundation of Vertebrate Zoology, Camarillo; ph., photograph; sr, sight record only.

Five species and two subspecies have been added to the list since the publication of the San Diego County Bird Atlas:

Siberian or Japanese American Pipit (*Anthus rubescens japonicus*): The identification of a vagrant of this Asian subspecies in the Tijuana River valley 11–13 October 2003 (Guy

McCaskie, *North American Birds* 58:145, 2004) was supported by photographs taken by Larry Sansone on 13 October.

Crested Caracara (*Caracara cheriway*): One found along Dairy Mart Rd. in the Tijuana River valley 9 September 2006 remained in the general area through at least 25 December 2007, being seen sporadically east to San Ysidro and west to the Tijuana River mouth. The identification is supported by many excellent photographs and one wing feather picked up 17 September 2006 (SDNHM 51546). Also, given the proliferation of sightings of the Crested Caracara elsewhere in California, the California Bird Records Committee reversed its previous decision questioning the source of the individual photographed at the Chula Vista Nature Reserve on 9 February 1995 (Barbara C. Moore, Ross Christie) and now considers it a natural vagrant.

Broad-tailed Hummingbird (*Selasphorus platycercus*): One adult male came to a feeder along Kay Dee Lane, Ramona, 1.7 miles east of Mt. Woodson (atlas square L13), 10–18 September 2006 (Gretchen Cummings, photographed).

Eastern Orange-crowned Warbler (*Vermivora celata celata*): Suspected previously on the basis of sight identifications but is now confirmed by specimens picked up on Keck Ct. in Rancho Peñasquitos, San Diego (atlas square N10), 26 April 2007 (SDNHM 51728) and on University Ave. in San Diego 25 November 2007 (SDNHM 51858)

Newell's Shearwater (*Puffinus auricularis newelli*): One found at night on sea bluffs at Del Mar 1 August 2007 by Charles Swanson was the first of its species ever found in California or on the North American continent; see <http://www.sdnhm.org/research/birds/shearwater.html>.

Bridled Tern (*Onychoprion anaethetus*): One associated with other terns nesting at the Santa Margarita River mouth, Camp Pendleton, 14–23 August 2007 (Carol McKie Manning, Brian D. Foster, photographed). It was only the second Bridled Tern identified in California.

Cory's Shearwater (*Calonectris diomedea*): One seen offshore at the north end of the Nine-Mile Bank on 4 September 2007 by David W. Povey was presumably the same individual of this Atlantic Ocean species seen regularly on Los Coronados Islands since summer 2005.

Changes from appendix 1 in the *San Diego County Bird Atlas* are noted with **boldface type**.
